

Tetrahedral Geometry

1/31

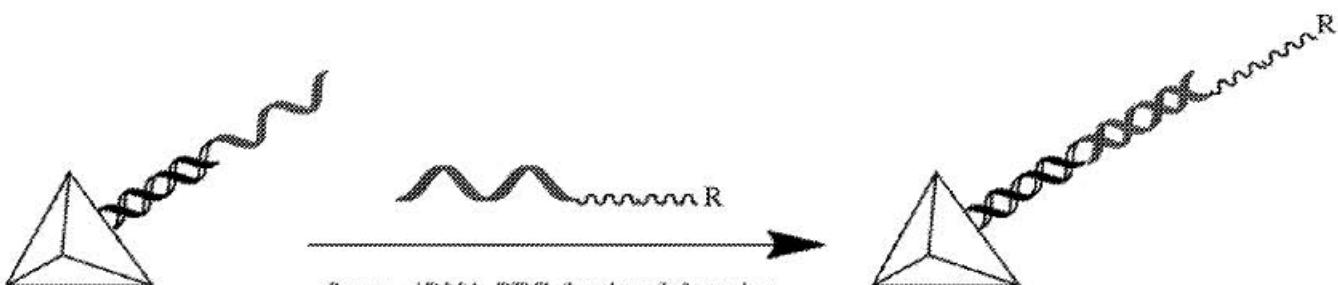

$$x = \frac{a}{\cos\left(\frac{\pi}{6}\right)} = \frac{1}{\sqrt{3}} a,$$

$$h = \sqrt{a^2 - x^2} = \frac{1}{\sqrt{3}} \sqrt{6} a.$$

3/31

- DNA hybridization allows precise control of polyhedron geometry
- Defined and relatively easy modification on spacing and spatial orientation of RNA, functional moiety, and others
- DNA/RNA nanoparticles can be used as a building block for higher order structure

- To facilitate intracellular delivery of DNA/RNA tetrahedron particles, conjugation of cell penetrating peptides were investigated.
- In addition to non-targeted approach, folate receptor mediated uptake was also investigated

List of cationic peptides:

1. HpH-1: YARVRRRGPRRGCG
2. Penetratin: RQIIWFQNRRMKWKK
3. HP4: RRRRPRRRRTTTRRR
4. TAT: GRKKRRQRRRPPQ
5. MAP: KLALKLALKALKAAALKLA

Non-charged peptides from Manos:
23 different peptides

Receptor mediated delivery: Folate
